

BUILD HANDOFF

What we built, a look at the screens, and what's needed to take Stripe & Resend live.

WHAT WE BUILT

The Pakistani Creative Collective platform is a Next.js app with a Postgres database (Supabase), styled to the brand spec (colors, fonts, logo, illustrations) with the full creative-profile and contact-request experience implemented.

Public site

- Home page, member directory (free preview vs. full paid view), and individual creative profiles.
- **Free visitors** see: name, role(s), experience level, location, bio, and one public link.
- **Paid subscribers** additionally see: headshot, education, languages, mediums, social/portfolio links, primary work sample, and a "Work For Hire" card (rate info, travel, collaboration preferences).

Creative application flow

- Public "Apply to Join" form (free) → admin review queue → approve/reject → applicant is emailed and gets a live profile.

Contact requests

- Paid subscribers request an introduction via a form matching the spec: requester info, experience level, request type, message, timeline, and consent.
- Submissions route to the admin panel; admin can forward to the creative or mark accepted/declined.

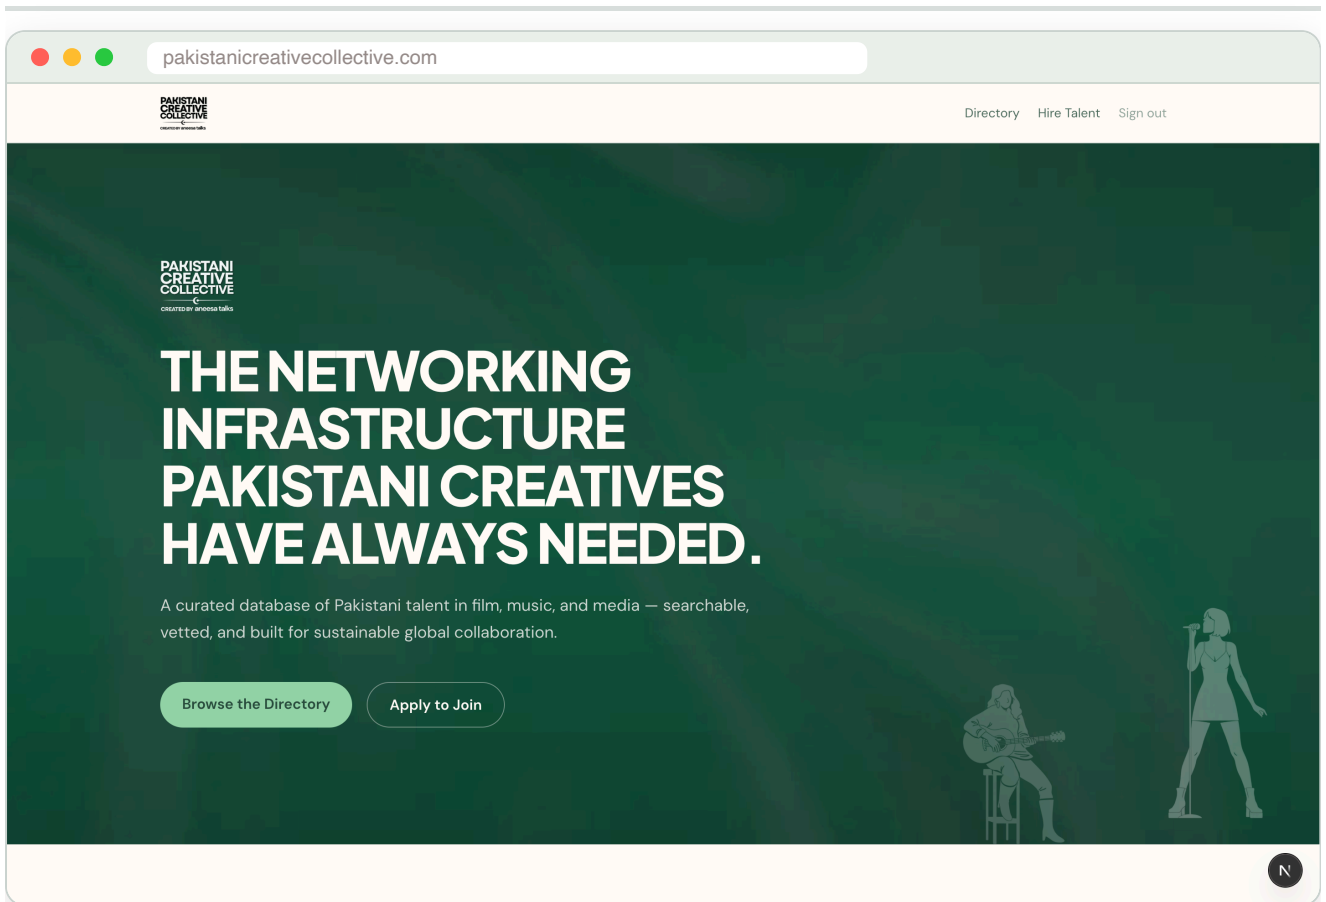

Subscriptions

- \$30/year early-access rate (pre-launch signups) vs. \$50/year standard, enforced server-side.
- Stripe Checkout + Billing Portal are wired up, but **currently run in a safe demo mode** (below) since live keys aren't set.

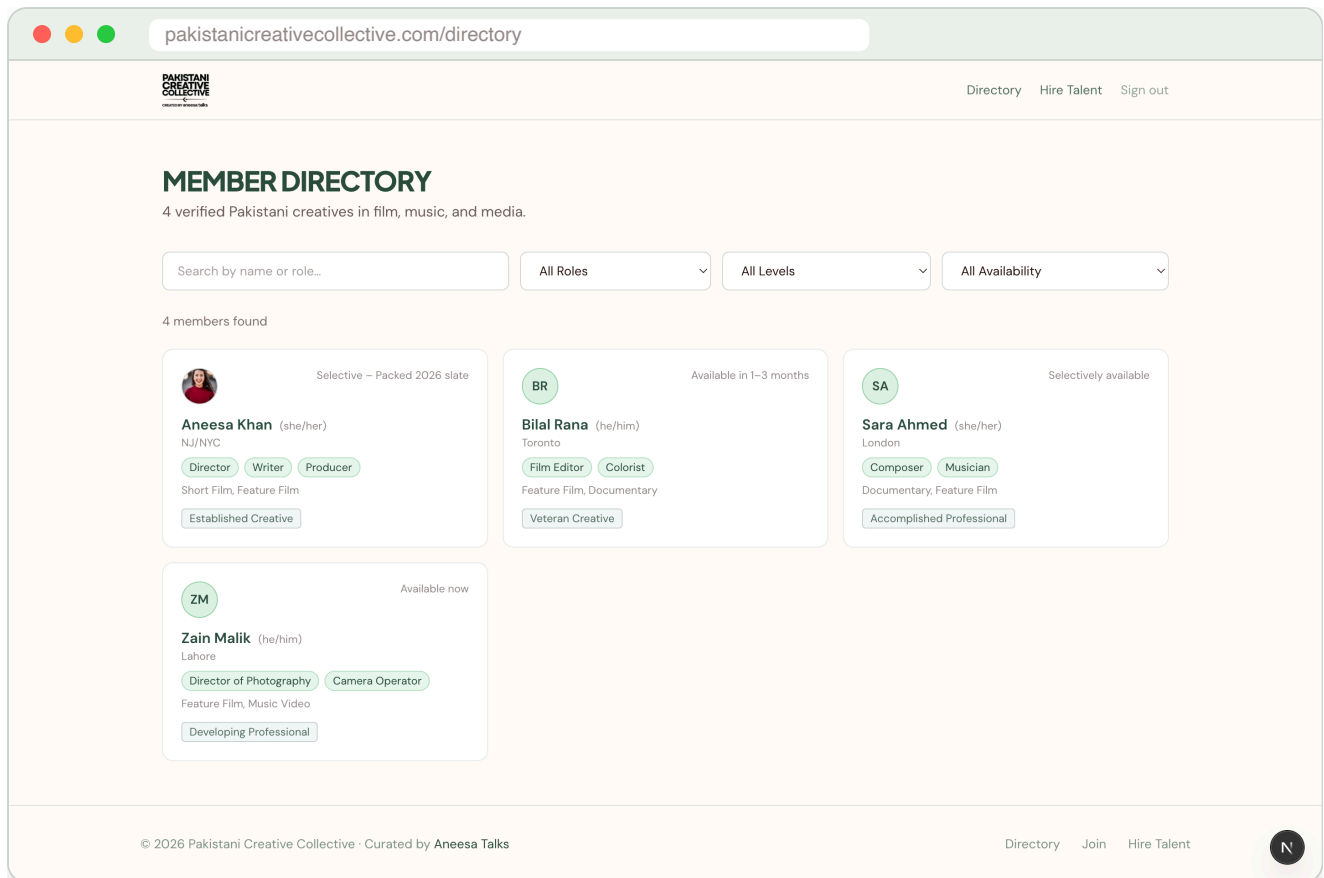

Admin panel & tests

- Applications, contact requests, feature requests, and basic analytics (kept on a simple internal dark theme).
- Vitest suite (`npm test`) covering signup/login, enrollment, contact requests, feature requests, admin moderation, and checkout — 30 tests, all passing.

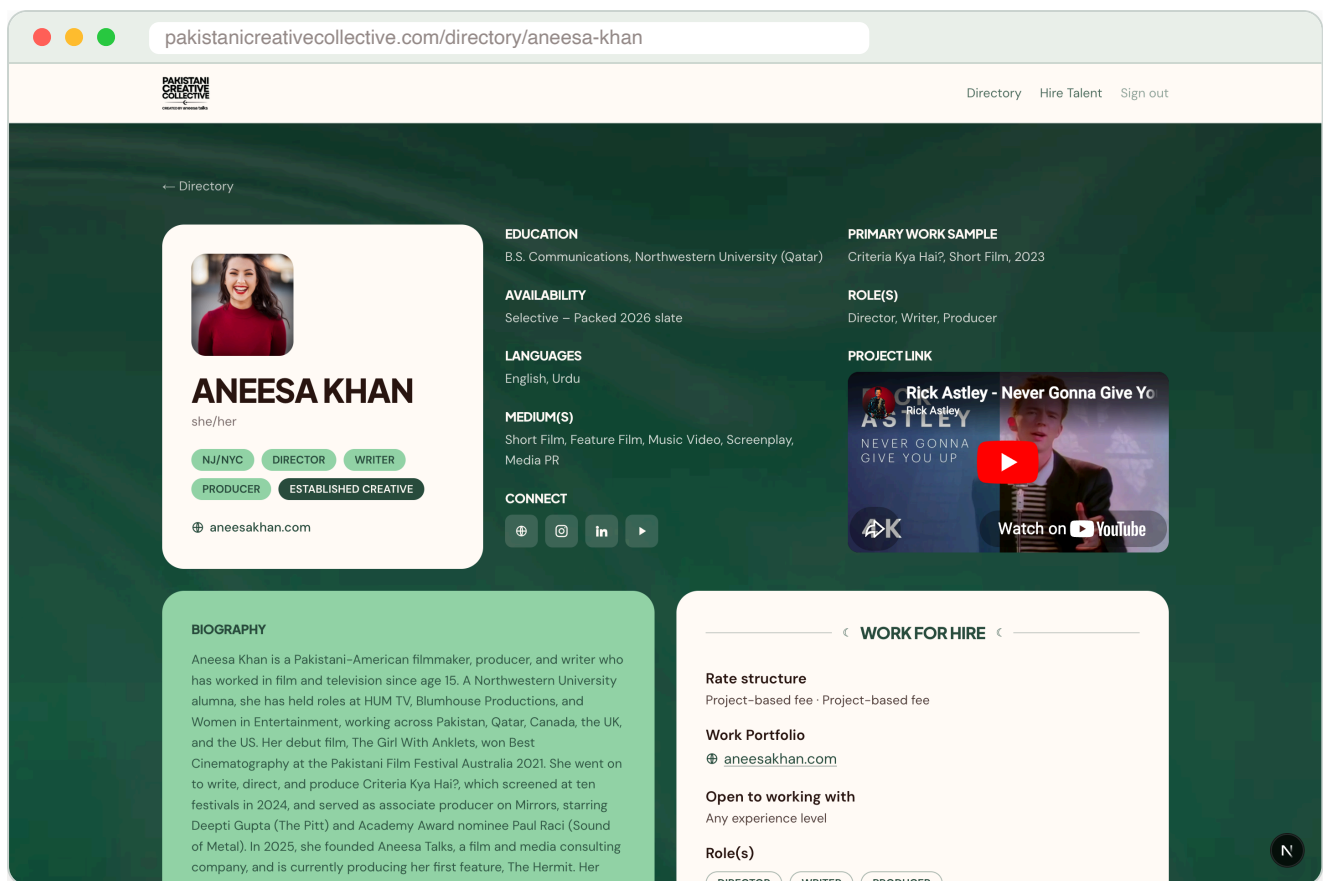

THE SCREENS

Home. Hero on the brand's textured green with the logo lockup and primary calls to action.

Directory. Searchable, filterable grid of vetted members (role, level, availability).

Creative profile (paid view). Identity card, biography, education/availability/languages/connect, an embedded work sample, and the "Work For Hire" card — matching the brand mockups.

CONTACT REQUEST FOR ANEESA KHAN

This request will be reviewed by Aneesa Talks and forwarded to the creative. They decide whether to connect.

ABOUT YOU

Full Name *

Email Address *

Company (if applicable)

Your Role/Title

Portfolio Link

https://...

YOUR EXPERIENCE LEVEL

Requests are only forwarded if your experience level matches the creative's stated collaboration preferences.

☐ Emerging Creative (0-2 years / 1-3 projects)

☐ Developing Professional (2-4 years / 4-8 projects)

N

Contact request. The full intake form (about you, experience level, request type, timeline, consent) routed to the admin queue.

DEMO MODE (NO REAL CHARGES OR EMAILS YET)

With `STRIPE_SECRET_KEY` and `RESEND_API_KEY` unset:

- The subscribe page shows a "demo flow" banner and a "Simulate payment" button instead of real checkout. Clicking it marks the account paid (no money moves) and shows a success page noting the payment was simulated.
- Application / approval / rejection / contact-request emails silently no-op — the in-app success screens still show, but no email is sent.

So the site is fully demoable end-to-end today without either vendor account.

WHAT'S NEEDED BEFORE GOING LIVE

Stripe — subscription billing

Used for: charging the \$30/\$50 annual subscription, the self-serve billing portal (update card, cancel), and keeping subscription status in sync via webhooks.

1. Create a Stripe account and switch to live mode.
2. Create two recurring Prices: \$30/year ("early access") and \$50/year ("standard").
3. Set environment variables on the host:
 - `STRIPE_SECRET_KEY` — from the Stripe dashboard
 - `STRIPE_PRICE_EARLY` / `STRIPE_PRICE_STANDARD` — the two Price IDs
 - `STRIPE_WEBHOOK_SECRET` — from a webhook endpoint pointed at `/api/webhooks/stripe`, listening for `customer.subscription.created/updated/deleted`
4. Once set, the demo banner disappears and real Checkout takes over — no code changes needed.

Resend — transactional email

Used for: notifying the team of new applications and contact requests, and notifying applicants/creatives of approval, rejection, and feature selection.

1. Create a Resend account.
2. Verify the sending domain (`aneesataalks.com`) by adding the DNS records Resend provides — required before it will deliver mail from `noreply@aneesataalks.com`.
3. Set `RESEND_API_KEY` on the host. Every email flow then activates automatically.

OTHER REQUIRED ENVIRONMENT VARIABLES

- `DATABASE_URL` — Supabase connection. **Use the pooler connection** (`...pooler.supabase.com:5432`), not the direct `db.<ref>.supabase.co` host (which is IPv6-only and won't resolve from many networks).
- `SESSION_SECRET` — random 32+ character string for signing login sessions.
- `NEXT_PUBLIC_APP_URL` — the deployed site URL (used in email links and Stripe redirects).

NOTE ON THE HEADER FONT

The spec calls for **Garet** (bold, all-caps, tight letter-spacing). Garet is a licensed font not available on Google Fonts, so **Plus Jakarta Sans (extrabold)** is substituted as the closest open-license match. If you license Garet, swapping it in is a small change in `src/app/layout.tsx`.
